Release approval — Round 2 (changes 9–21)

Document purpose. Everything requested from the user's side in round 2 — the emergency-contact fix and the whole Breathe rebuild — written so someone who does not read code can see what changed, what already shipped, and the single action that is still left. Round 2 is **already merged and live on the server**; this pack is the record of it plus the one open decision (installing the new app build).

Prepared: 5 November 2026, 07:35 UTC **Branch:** `feat/app-change-round-2` (commits `45cf26b…89308ab`) → merged to `develop` as `940edf861bae` **Companion files:** `docs/APP-CHANGE-LOG.md` (one row per change, files and test counts), `docs/CLINICAL-REVIEW-BREATHING-COPY.md` (Dr Goswami's signed-off copy).

If this document and the change log disagree, the change log is the record of what was built and this document is out of date.

1. What is being asked for

Four things, split by the risk each one carries. Three are already done; the fourth has not happened yet.

#	Approval	What it authorises	State	Risk if wrong
A1	**Code release** (server, worker, therapist portal, one database migration)	Therapy-facing services roll to the new version	**Done — live 5 Nov 2026 04:21 UTC** (rollback: api `:66`, worker `:64`, portal `:66`)	A bad release is undone by pointing the services back at the previous revision
A2	**Cloud (AWS) change**	The API may read one specific encryption key	**Done — live 3 Nov 2026 18:29 UTC** (it is row 8's infra half, carried over)	Security-relevant but narrow: one role, one secret, read-and-decrypt only
A3	**App install**	The new Android build `1.0.10+11` is installed on the test phone	**OPEN — this is the only thing left**	Only affects the handset it is installed on; the previous APK reinstalls over it
C2	**Clinical sign-off** (Dr Shubhangi Goswami)	The breathing techniques, their copy, the pace numbers and the pause/break wording	**Received 3 Nov 2026 19:15 UTC** — "approved with changes", built to her text	Clinically unverified instruction reaching a client at a vulnerable moment

Nothing is held on clinical grounds. Dr Goswami's reply is quoted in `docs/CLINICAL-REVIEW-BREATHING-COPY.md` with its message id; the copy in the app carries her version and approval date, so editing a sentence after approval is visible in the file and needs a fresh review.

2. The changes, in plain English

Settings

1. **The Emergency Contact phone number now saves, as a plain 10-digit number.** Type `9876543210`, tap Save, it saves. Anything that is not exactly ten digits shows "Enter a 10-digit phone number (e.g. 9876543210)" instead of sending something the server will refuse. *Why it was broken: the number was never the problem. The server had no encryption key installed and no permission to fetch one, so every save failed before the number was looked at. That was fixed in row 8; this round changes the format and the validation.*

Breathe

1. **One drop-down instead of four big buttons, so the guide is visible.** The exercise list used to take most of the screen. It is now a single "Exercise" drop-down at the top, with the breathing visual below it fully in view.
2. **A small (i) explains each technique.** Next to the drop-down. Tap it and you get plain words on what the technique is, how to do it, why it helps, and what to do if it feels like too much — the thing you would otherwise have to remember from a therapy session.
3. **One normal pace per technique, at Dr Goswami's numbers.** Slower / Standard / Faster is gone: twelve choices with no guidance became four techniques each with the pace the therapy books use. Box 4 in / 4 hold / 4 out / 4 hold. Physiological sigh a full breath in, one more small sip, then a long breath out. Extended exhale 4 in / 8 out. Humming breath 4 in / 6 hum out.
4. **The set of techniques is hers.** She read the four explanations and said Guided breathing and Extended exhale "are essentially the same exercise", so **Guided breathing is out and Humming breath (the yoga bee breath) is in**. Her wording, headings included, is what the (i) panel shows.
5. **A sitting is three rounds of ten breaths.** Ten breaths, then the app pauses and asks "Let's pause here. How are you feeling now?" with three taps — Calmer / About the same / Worse — and **Continue** or **Stop for now**. Continue gives another ten. After thirty breaths it rests: "That's 30 breaths. A good place to rest", with Done and a smaller Talk to Okuvu, so it is not a wall at 2 a.m. Tapping **Worse** offers Okuvu and the helplines straight away. Stopping early says "You took a moment for yourself" and deliberately shows no count, because a count reads like a score. **The physiological sigh pauses after five breaths** and ends at fifteen, her ceiling, because repeated sighing can make people light-headed.
6. **The number and the shape now move together.** They did not: the number advanced every 0.9 seconds while the shape grew over the full 4 or 6 seconds, so the count finished early while the circle was still moving, and the voice reading digits stretched it further. The number now shows the seconds actually left in that part of the breath, the shape takes exactly that long, and the voice says the step instead of counting over it.
7. **Each technique looks different.** Box breathing: a dot travelling round the four sides of a square. Physiological sigh: a circle that fills, swells a little more, then empties, with no digits. Extended exhale: a wave rising quickly and falling slowly. Humming breath: ripples spreading from the centre while you hum.
8. **"Done. How do you feel now?" no longer appears on an exercise you never started.** The card kept its finished state while the screen swapped the exercise underneath it, so an untried technique inherited the last one's ending and a running counter kept climbing (`5/3`). Every technique now starts clean when you pick it.

Dropped

1. **No physiological-sigh video.** She asked for a 20–30 second clip. You decided against video support and kept the on-screen animation plus her written explanation, so nothing is filmed, generated, downloaded or billed. The video tooling was deleted, not switched off. She has been told and has approved (4 Nov 2026).

3. What shipped — technical requirements

3.1 Server (api, worker, therapist portal) — A1, live

Route / change	Purpose	Guards
`PATCH /settings/emergency-contact`	Store the contact name and 10-digit phone	Authenticated; `^\d{10}$` after stripping spaces, dashes, dots and brackets; encrypted before storage
`GET /journal/prompts`	Serves the 52-prompt library (round 1, ships in the same image)	Authenticated; no model call; 503 rather than an invalid library
`GET /sessions`, `GET /sessions/:id`	Past conversations (round 1)	Authenticated; owner-scoped `findFirst`, another user's id is a 404

The server's tool-card defaults also changed: one pace per technique at her numbers, plus the new humming-breath tool, so an older client asking for a card still gets an answer.

Database: one migration, `20261104000000_add_humming_breath_tool` — adds the humming-breath registry row and her one-line copy for the sigh and extended exhale, so the therapist's assigned line and the (i) panel cannot describe different breaths. It inserts rows; it rewrites no existing data. It ran inside the release build, before the services rolled.

Compatibility: the build already on a handset keeps working. Every new field is optional in both directions, and the old three-pace table is still served for older clients.

3.2 Phone app (Android) — A3, built and not yet installed

- Build `1.0.10` / versionCode `11` (prod flavour), signed with the upload key `CCB4CA39…FF96`.
- Screens touched: Breathe (drop-down, (i) panel, four animations, session flow), Emergency Contact (10-digit field), plus round 1's screens which ride in the same APK.
- `apps/mobile/lib/src/features/home/breathing_content.dart` holds her approved copy as data, version `2.0.0`, with her approval date and reply id — the gate travels with the text.
- `apps/mobile/lib/src/features/chat/widgets/breathing_visuals.dart` draws the four visuals from the same animation clock the countdown uses, so a shape cannot drift from its number.

3.3 Infrastructure — A2, no new change this round

Row 8's secret, the two IAM statements and `AWS_SECRETS_PREFIX` were applied by hand on 3 Nov. This release is the code that reads them.

4. Gates

Gate	Evidence	Status
API test suite	1684 tests on the merged tree	Met
Worker suite	93 tests	Met
Therapist portal	316 tests + `tsc --noEmit` + `next build`	Met
App tests	`flutter test` 333 of 333; breathing files 32 of 32	Met
App analyser	`flutter analyze` clean	Met
Secret scan	clean on the merged tree	Met
Server build	`evia-beta-build:d533b39d` SUCCEEDED; POST_BUILD `OK api` / `OK worker` / `OK portal`	Met
Migration	`Applying migration 20261104000000_add_humming_breath_tool` then `All migrations have been successfully applied`	Met
Live identity	`/health` answers `{"status":"ok","commit":"940edf861bae"}`, equal to the deployed image tag	Met
New routes mounted	`/settings/emergency-contact` 401, `/journal/prompts` 401, `/sessions` 401, invented route 404 — authentication refused, so the handlers are in the running image	Met

Gate	Evidence	Status
App artifact	`verify-mobile-release.py`: RELEASE OK, 26 of 26 checks; APK sha256 `602a2f345ce8715d7b300ac323b1cbad9bc272b873e807c69338c2c3c63fb8ed`; gate matched the artifact's own commit to `/health`	Met
Clinical copy (C2)	"Approved with changes", 3 Nov 2026 19:15 UTC, message id `1a1a2d6769fe9e01`; built to her text	Met
Screen seen on a handset	**No device and no emulator on this host** — tests and analysers only	Outstanding (needs A3)

5. State of the world — verified 5 November 2026, 07:30 UTC

- `develop` head: `1d0ecd2` (change-log entry for this rollout). Round 2 merged as `940edf861bae`.
- Deployed images: api `940edf861bae` (task definition `:67`), worker (worker suite `:65`), portal `:67`. `/health` 200, answering `940edf861bae`.
- Database migration applied 04:21 UTC in the same build.
- App artifact `1.0.10+11` built from `940edf861bae`, clean tree, at `/opt/data/okuvu/wt/ship-1.0.10/apps/mobile/build/app/outputs/flutter-apk/app-prod-release.apk` (59,969,491 bytes); copied for handover to `/opt/data/okuvu/releases/okuvu-1.0.10+11-prod.apk`.
- **Nothing is published on Play** — both listing URLs answer 404 — so distribution is the side-loaded APK. "Live" for every app row therefore means "installed on the handset", which has not happened yet.
- Round 1's app rows (1–7) are in this same APK. Their server half has been live since 3 Nov.

6. Runbook (dependency order)

Already executed, in this order, on 5 November:

1. Migrations ran inside the release build — before any service rolled. — done
2. api, worker and portal rolled to the images carrying them. — done
3. Live identity and new routes verified against the running services (401, not 404). — done
4. App artifact built from the merged commit and verified against `/health`. — done

What remains:

1. **Install** `okuvu-1.0.10+11-prod.apk` **on the test handset** (A3). This is the only step that has not happened, and it is the only way any of the app-visible rows above becomes visible.
2. Then open Breathe and Settings and confirm by eye: the exercise drop-down, the (i) panel, ten breaths then the pause with three taps, the rest line at thirty, and a saved 10-digit emergency-contact number.

Rollback targets, recorded while they are still in hand: api `:66`, worker `:64`, portal `:66` (the previous revision), and the previous APK `1.0.9+10`. The migration is additive and does not need undoing to roll back code.

7. Risks and open items

1. **No handset verification.** Every app claim here rests on tests and static analysis; no screen has been seen running. Install is the gate.

2. **Row 19(b) is design only — breathing outcomes are not stored.** Dr Goswami asked that the technique, breath count and tap answer be recorded and shown to the therapist only when breathing is homework or the client has shared. That needs a new table, an endpoint and a consent-gated therapist view: a release of its own. **Nothing is stored today, so the taps are not being saved.** No client data is being collected in the meantime, which is the safe failure direction.
3. **Row 8's unexplained item is still open.** On 2 November the app's consent screen tried to save twice and the server refused both times. Which build sent them is unknown, and no code was changed on a guess. It stays an open item until it reproduces.
4. **No Play listing.** Distribution is a side-loaded APK, so there is no staged rollout and no automatic update; a handset keeps whatever was installed until someone installs the new file.

8. Approval

	Decision
A1 — code release	**Done** — 5 Nov 2026 04:21 UTC. No signature needed; recorded for the file.
A2 — cloud change	**Done** — 3 Nov 2026 18:29 UTC.
C2 — clinical copy	**Received** — 3 Nov 2026 19:15 UTC.
A3 — app install	Decision needed: **approved** — install 1.0.10+11 on the test phone / **hold**

Owner decision: _____ Date: _____

Prepared by Keel Assist for Rajwant. Technical record: `docs/APP-CHANGE-LOG.md`.
